WOVEN-IN TOUGH ZIPPER

EYLA CHAIN P16 DYED HANK200
EYL ZF5W NL PARTS SP-SIL707

- Flat Appearance & Low element profile
Reduced chain thickness by approximately 15%* less compared to our standard racquet coil zipper.
*This value may vary by chain size, color.
- Abrasion resistance
Precisely engineered to pass the tough abrasion resistance test.
Higher abrasion resistance compared to our standard racquet coil zipper.
- Repairable
New innovative slider system provides zipper pull tab replacement.
*YKK takes no responsibility for the change in quality and performance of its products caused by parts manufactured by a third party other than YKK or processes carried out by party other than YKK.

	<p>With Reversible Slider</p> <p>Dimension (A) Throat of the Slider to Open Parts End</p> <p>Top Extension (B) Upper Top Stop End to Cut Tape Tip (to the Top Tip If Jagged)</p>
	<p>Top-Open</p> <p>Dimension (A) Upper Top Stop End to Open Parts End</p> <p>Top Extension (B) Upper Top Stop End to Cut Tape Tip</p>

Dimension Tolerance and Ways of Measuring

Completely close the zipper when measuring.

The indicated zipper dimension has the specified tolerance as follows:

Product Dimension	Maximum Tolerance
≤ 300 mm	± 5 mm
$300 \text{ mm} < D \leq 600$ mm	± 10 mm
$600 \text{ mm} < D \leq 1200$ mm	± 15 mm
$1200 \text{ mm} <$	$\pm 2.0\%$

(as per JIS S 3015)

※Some special products may not meet the above tolerance.

Methods to Evaluate Zipper Strength

There are various ways to evaluate zipper strength. Basic strengths are determined by the following tests (based on JIS S 3015:2019), then the appropriate application for each item is determined.

※Tensile Testing Machine Conditions — Tensile Speed: 300 mm/min, Clamp Width: 25 mm

Chain Crosswise Strength (per 2.5cm width)

An engaged zipper chain is pulled crosswise as shown at a constant speed.

Open Parts Crosswise Strength

Only the open parts are set at the clamp of the tensile testing machine and pulled crosswise.

Retainer box pull off Strength

A jig is attached to the retainer box and is pulled in the vertical direction to measure the strength.

Retainer box pull off Strength

The bottom part of one side of the zipper is fixed, the slider is pulled up to the top stop, and then it is pulled hard to measure the vertical pull off strength.

※The standard is 70 N. However, this is limited to items for children. Application of the standard shall be discussed between the supplier and customer.

Top Stop Holding Strength

The lower part of an engaged zipper is held securely, then the slider pulled to the top is further pulled upwards.

Bottom Stop Holding Strength

The slider is pulled down to the bottom stop, and each side of the chain is pulled out to each direction.

Slider Locking Strength

The slider lock is engaged in the middle of a chain, then each side of the chain is pulled out to each direction.

Slider Mouth & Pull Holding Strength (90°)

Tension force is applied to both the pull-tab and the body bottom of an assembled slider. In addition to the shown 90° angle, 45° angle is also tested. (Tensile Testing Machine Speed: 100 mm/min)

Slider pull-tab twisting Strength

The body of the slider is fixed, and with the pull-tab positioned stood vertically, it is twisted to 180° to measure the strength.

※Twist tester: Twisting speed - approximately 9°/sec

Besides above JIS strength tests, YKK zippers meet BS reciprocating endurance requirement.

Strength Standards (Based on JIS-S2015:2019)

All standard YKK zippers meet JIS requirements

When selecting zippers, please check the strength required for the intended application.

YKK also sets its own quality standards to produce and provide better quality products.

Even items meeting the same JIS class have different strengths per item, so please contact YKK representatives for more detailed specifications.

JIS Classification

Class		Ultra Light	Light		Medium		Medium-Heavy	Heavy	Ultra Heavy
Chain Width (mm)		2.5 - under 4.0	4.0 - under 5.5		5.5 - under 7.0		7.0 - under 8.5	8.5 - under 12.0	12.0
Individual Element	MG		3MG	4MG	5RG	7MG	8MGM	10MG	
	YG		3YGR	4YG	5YG				
	VF		3VS	4VS	5VS		8VS	10VF	15VF
Continuous Element	CF	2CF	3CF	45CF	5CIF		8CF	10CF	
	EF		4EF		5EF				
	CH		2CH	3CH					
	FK		25FK						

※Zippers are classified according to their chain width (i.e. the width of the engaged elements).

※Individual Element: Element type of Metal zipper and Vislon zipper.

※Continuous Element: Element type of coil zipper.

Strength Requirement according to JIS Standard

Proper Use of Zippers

1 Rough Slider Operation

Do not force the slider even if it doesn't move smoothly, or it may cause the elements to misengage.

Apply paraffin or wax on both front and back surfaces of the elements, then move the slider back and forth to regain smooth operation.

2 Pulled Out Elements

Trying to forcibly close the zipper of an overfilled bag will cause element and tape breakage due to the excess load on the elements.

Reduce the burden by reducing the content of the bag and by bringing both sides of the chain close to each other before closing the zipper.

3 Fabric Caught in Slider

A slider may catch the fabric and get stuck during its operation. Avoid forcing it to move or it will worsen the problem.

Slowly move the slider while pulling out the caught fabric

Please allow enough room for the slider to move smoothly when sewing the zipper onto the fabric.

4 When Dressing / Undressing

Make sure to completely open the zipper when dressing / undressing. Dressing / undressing without completely opening the zipper may damage elements / slider function.

When closing the zipper, the slider will move more smoothly if the hook & eye or the top button is fastened beforehand.

5 Proper Ironing Procedures

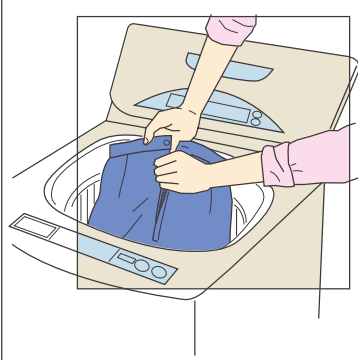

Not only the garment fabrics, but also zippers have appropriate ironing temperature according to their materials. Please keep the specified ironing temperature to maintain the zipper quality.

Also make sure to completely close the zipper, lay down the slider pull-tab in the regular position and place ironing fabric on the zipper.

CONCEAL®	160°C
FLATKNIT®	150°C
VISLON®	130°C
Coil Zippers	160°C

(Pressure: 1.5kg, Applied for 10 sec.)

※Direct ironing onto elements or sliders may cause undesirable effects.

6 Proper Laundry Procedure

Make sure to completely close all the zippers when using the washing / drying machines. Incompletely closed zipper may be entangled with other load and result in element or slider damage or damage on other fabric.

Long or slim slider pull-tab may be caught in the drum holes and break, so the use of a laundry net for those items is recommended.

After the drying process, do not operate the zipper until the garment temperature has cooled down.

Strong alkaline detergent or chlorinated bleach may affect zipper operation. In that case, use softeners, paraffin or wax to regain the smoothness.

Do not presoak garment with zippers in washing solution, or it may cause significant damage.

Proper Use of Open-End Zippers

1 Open-End Zipper

◆When closing

1. Completely pull down the slider until it touches the retainer box.
2. Fully insert the insert pin to the box. (Incomplete insertion may cause troubles.)
3. While holding the insert pin side with the right hand, pull up the slider with the left hand.

◆When opening

1. Completely pull down the slider until it touches the retainer box.
2. Gently pull out the insert pin with the right hand

2 Two-Way Open

◆When closing

1. Pull down the upper slider until it touches the bottom slider.
2. Insert the insert pin to the very bottom of the bottom slider. (Incomplete insertion may cause troubles.)
3. Pull up the upper slider with the left hand.

◆When opening

1. Completely pull down the slider until it touches the bottom slider.
2. Gently pull out the insert pin with the right hand

Guide to Effective Use of Metal (Copper Alloy) Zippers

1. When Metals Change Color

Copper alloys generally react with such chemicals as acids, alkalis (bases), oxidizing agents, reducing agents, and sulphides, often forming colored salts. When these chemicals are abundant in adjacent materials, a color change can take place on metal parts, such as elements, sliders, and top and bottom stops or open parts. These chemical reactions occur more readily in hot and humid conditions. For example, if products are pressed after the sewing process with a steam iron and wrapped straight away, or are packed in plastic bags for a long time, this kind of reaction is likely to happen.

Reactive dyed fabric may discolor and sulfur dyed fabric may cause the copper alloy to discolor and stain.

■Woolen Knit Products

When metal zippers are attached to bleached woolen knit products, a color change can take place. Generally, woolen products are bleached by the following methods:

- (1) Using an oxidizing bleach (hydrogen peroxide, etc.)
- (2) Using a reducing bleach (hydrosulphite, etc.)

Furthermore, some woolen products are treated with chlorine oxidizers for a shrink-resistant finish.

If sufficient washing or neutralization has not been made after treatment, especially with hydrosulfite or chlorinated agents, gas (chlorine gas or sulfur dioxide gas, etc.) can be generated. These hydrosulfite and chlorinated agents can also react directly on metal in humid conditions. For example, if woolen products are put into bags immediately after pressing and kept as they are, various chemicals and gases will cause a color change on the metal parts of copper alloy zippers.

Solutions

- Use thoroughly washed, neutralized, and dried woolen fabric.
- Take sufficient time before wrapping after the products are pressed.

■Leather Products

A color change can be caused by residual tanning agents or acids used in the leather tanning process. Tanning agents such as sulfuric acid and other mineral acids, chromium compounds, tannic acids, and aldehyde compounds are used. Since the main ingredient of leather is animal protein, leather cannot naturally or easily rid itself of those tanning chemicals, and a large quantity of chemicals often remain. When such leather comes in contact with metal zippers, it can cause a color change in zippers over time in humid conditions.

Solutions

- Use leather which has been sufficiently washed and neutralized after tanning.
- Conduct preliminary testing.

Changing color of metal parts (under hot and humid environment)

After 72hours

2. When metal zippers contaminate fabric with certain finishes

Chemical reaction caused by acidic substances or oxidizing agents

When acidic substances or oxidizing agents remain in the fabric used for products after dyeing or finishing, they can cause chemical reaction on GKB or GK metal zippers and can stain the portion where the zippers are in contact, especially with white or light-colored fabric. Also, the zippers are likely to cause chemical reactions with reactive dyestuff.

Solutions

- Use material and fabric which has been sufficiently washed and dried after treatment.
- Insert a sheet of paper between the zipper and the garment fabric when packaging.

Transfer of paraffin to fabric, which has waterproof or water-repellent treatment

Metal zipper elements are coated with paraffin to make them work smoothly. When metal zippers are attached to fabric which has waterproof or water-repellent treatment, the paraffin can melt during pressing and transfer to the fabric, staining it.

Solutions

- Press with an iron after inserting several sheets of paper or fabric between the zipper and the material.

Discoloration and color change of cotton products dyed with reactive dyestuff

Reactive dyestuff used for over-dyeing cotton products contains metal ions. Discoloration or color change of the fabric may occur in humid conditions when the dyestuff reacts with copper alloys used for metal zippers.

Solutions

- In case of over-dyeing, dry sufficiently and keep the products in a dry place.
- Avoid sealing the garments in plastic or vinyl bags.
- Avoid warm and humid environments when storing or displaying the garments.

When GKB or GK golden brass zippers are used

The metal parts of surface-treated copper alloy zippers, such as the GKB and KB, can discolor or contaminate adjacent fabric.

Solutions

- Insert a sheet of paper between the zipper and the garment fabric when packaging.
- The possibility of garment contamination can be reduced by specifying a lacquer treatment on the zipper when ordering.

Discoloration of fabric caused by contact with the metal zippers (under hot and humid environment)

Cautions for Aluminum Alloy Zippers

Aluminum alloy zippers are used in some applications because they are light-weight, but it has some disadvantages due to its nature. Please observe precautions for proper use of the aluminum alloy zipper.

◆ Nature of Aluminum Alloy Zippers

Aluminum is easily affected by moisture, temperature and humidity, and vulnerable to shock, friction, acidic or alkaline element. Therefore, Aluminum alloy zippers are not suitable for harsh treatment such as jeans washing or over-dyeing.

1. Elements Dissolving

Jackets and pants are frequently subject to washing at their finishing process. Aluminum is weak to alkaline and it is reported that strong alkaline solvents may melt the elements of aluminum alloy zipper. Please pay attention when chemicals as metasilicic acid side are used. Also make sure to rinse out those chemicals thoroughly and immediately.

〈Normal Elements〉

〈Dissolved Elements〉

2. Migration and Staining from Aluminum Alloy Zippers

Since aluminum is vulnerable to friction, metal dust is scraped off when operating zippers, which may stain the garment. When this metal dust combines with paraffin wax (which is necessary for smooth zipper operation), it may leave darker stains. Please pay extra attention when applying aluminum alloy zippers to light-colored garments.

※The stain can be removed to some extent by rinsing with any general detergents.

Stain by Aluminum

〈Elements〉

〈1 yen coin (made of aluminum)〉

3. Elements Wearing Out

Aluminum alloy zippers are vulnerable to friction, so its elements may get worn out over regular operation with zinc-alloy sliders with lock, such as DA/DP type. These zippers cannot be used with a copper-alloy slider such as GA/GS type, because the slider is hard and it may significantly damage the zipper elements.

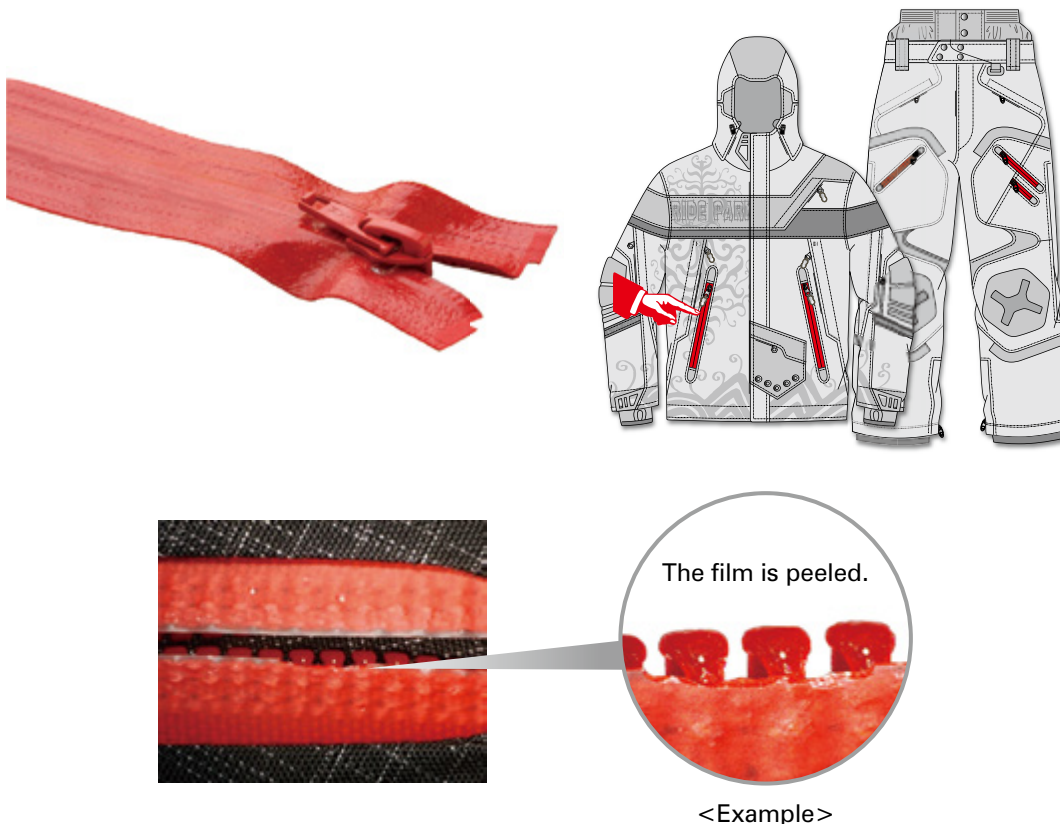

It is recommended to use the item "YAN", which is an anodized aluminum alloy zipper with improved durability. However, we suggest testing before the actual application of those products.

Care for AquaGuard® Zippers

- This zipper is not waterproof/watertight, but water repellent.
- Keep the zipper away from direct sunlight. UV rays may cause a yellowing of the PU (Polyurethane) film.
- The zipper must be completely closed when washing in order to avoid damage.
- Do not iron the zipper.
- A petroleum based dry cleaning solvent is recommended. Chlorine based solvents often result in difficulty in operating the zipper, color runs, or result in cloudy film.
- Tumble drying in a dryer may cause damage to the laminated film and result in the deterioration of the zipper's water repellency.
- Two PU zippers of contrasting color should not be used in a garment if they come into contact with each other for prolonged periods of time (storage, folding, etc.), since this may cause a color run.

Cautions for thermocompression bonding

During thermocompression bonding to fabric, the film is softened. If the slider is moved under this condition, there is a risk that the film on the tape partition will be lost.

Solutions

- To prevent it, please wait until the temperature becomes appropriate.

Care for AQUASEAL® Zippers

1. Care Instructions

- Please consult with YKK representatives in regard to the usage of AQUASEAL® products.
- Overstretching of the top and bottom stops should be avoided. A reinforcement strap feature is available.
- Slowly move the zipper when operating. Angular pulling may cause element mis-engagement and may result in poor waterproof performance or damaged zippers.
- Folding or crushing the zipper may affect its performance.
- Regular cleaning with fresh water and use of a suitable lubricant is advised in order to prevent damage to the tape and seals.
- Store away from heat and moisture.
- Do not dry clean or machine wash.
- Prevent solvents and adhesives from adhering to the elements.
- Plastic sliders, due to their material characteristics, may become damaged when they are exposed to a strong impact, so please handle them carefully.

2. Attachment

- ① Sewing: In order to prevent the entry of water through seams made by sewing machine, both the front and back faces of the seams must be blocked with seam tape or something similar.
 - ② Gluing: It will depend on the compatibility of fabric, zipper tape and glue.
 - ③ Hot melt: Thermosetting tape is also available.
 - ④ Welding: Can be welded at high frequencies (welder) and using heat (hot air).
- ※We recommend that you attach products to fabric materials such as PU and PVC fabrics.
※Please carefully check compatibility of the product and fabric when attaching using adhesive or via hot melt or welding.
※For details on attaching products, please contact YKK representatives.

3. Maintenance

- Regular maintenance, such as cleaning, is recommended for maintaining products' waterproof features.
 - We offer the "ZIP TECH™" which is dedicated lubricant for AQUASEAL® for maintenance purposes (sold separately).
 - Insufficient lubricant may be a cause of a decline in waterproof performance, so we recommend applying this regularly.
- ※This only relates to the W-SEAL top stop. (See the figure below for the application position.)
※Applying paraffin (wax) to the elements can maintain zippers to be opened/closed smoothly.

ZIP TECH™

Lubricant application position

"ZIP TECH™" is a trademark of McNett Corp.USA.

Care for PROSEAL® Zippers

1. Care Instructions

- Close the zipper till the slider completely touches the stop to ensure tightness.
- When opening or closing, always ensure that the direction of the pull is along the line of the metal elements. When closing, ensure that both sides of the open zipper are parallel. It is very important to avoid catching undergarments in the elements. If the slider should jam during closure, **DO NOT FORCE IT**. Pull back the slider, remove the obstruction, and slowly attempt to close it again. Excessive force will break the metal chain and destroy the zipper. Also avoid bending the zipper excessively as this will eventually cause the metal chain running inside of the zipper to break.
- As for PVC tape, do not use in an environment where the water temperature is under 10°C, as the PVC will harden and it will affect the zipper's performance.
- Due to the characteristics of PVC, its tightness will deteriorate over time.

2. Cleaning

- After using the zipper, it should be rinsed in clean water. Any objects (sand, mud, etc.) found in or outside of the elements before operating the zipper may result in poor tightness or may damage the zipper.
- Do not dry clean, machine wash, or iron.

3. Maintenance

- Occasional cleaning and lubrication of the elements after use is desirable. Such treatment is especially important if PROSEAL® zipper is used in a dirty or corrosive environment. After rinsing with fresh water, please lightly apply a lubricant such as paraffin to the part of the elements circled in red in the diagram below. After opening and closing the zipper several times, excess paraffin flakes should be removed.

4. Storage

- Store with the zipper completely open, taking care not to bend it. Storage of the zipper in a closed position for long period will cause malformation of the sealing areas. Also, storing it partially opened will cause the zipper to bend. Slight leaks are possible in such cases.
- Do not place any heavy object on the zipper.
- Prolonged contact with such surface materials as PVC or synthetic leather causes the PVC to react with their processing additives, which causes color migration (color transfer). Avoid direct contact when storing by placing a sheet of paper between the zipper and the material.

METALLION®, AUROLITE®, Combination Zippers, Clear Coil Zipper Caution When Washing and Dry Cleaning

Coil zippers where the tape is stitched to the elements after being dyed, such as Metallion®, Combination or, Clear Coil zippers, are more prone to twisting in comparison to standard coils when being subjected to high-temperature drying during washing and dry cleaning.

Supported Items

METALLION®

Combination Zipper (COMB-**)

Clear Coil Zipper

Please be aware of products with different tape, element and stitching colors.

Twisted Condition

Reproduction Test via Dry Cleaning

Solutions

Always close the zipper during washing and dry cleaning, and set the temperature to be under 100°C.

※Depending on the shrinkage rate of sewn material, the conditions will change slightly.

Discoloration problems caused by cleaning solvents

Discoloration problems due to the use of cleaning solvents containing large quantities of fluoride ions are known.

Experience suggests that solvents causing discoloration contain hydrogen fluoride (a strong acid), sulfuric acid, etc. These materials cause the following problems:

- ◆ **Discoloration or corrosion of sliders and top and bottom stops made of metal, and fittings**
- ◆ **Decolorization of plastic parts of VISLON® zippers**

In addition to commercially-sold fluorine solvents, unique cleaning solvents in which detergent is mixed with cooking vinegar - itself a strong acid - are also used. These types of solvent may remain on product fabric and directly or indirectly affect the quality of the zippers used. Problems particularly arise in products comprising light colored fabric.

Garment factories should be instructed to use appropriate cleaning agents that do not include corrosive substances.

If you have any questions related to the appropriateness of cleaning agents, please consult with YKK representatives.

Tips when ironing or pressing

When ironing or pressing garments that uses fastening products, please keep in mind of the followings in order to avoid unexpected damage or deformation.

All zippers

Close the zipper and be sure to use a protective cloth in order to prevent the iron from coming in direct contact with the zipper.

We recommend that you avoid ironing on or around the slider. If it is necessary to iron near the slider ensure the pull-tab is flat and in line with the elements.

Example: Correct direction of the pull-tab

○ Normal position

The space is large as compared to when the pull-tab is inversely positioned.

✗ Inverse position

There is no difference in the height between the body and the pull-tab, which tends to place a strain on the pull-tab.

Examples of damaged pull-tab / crushing

Bent pull-tab

Cracked slider

Crushed slider

All-plastic slider

Locked Position

Unlocked Position

If sliders are left in a high-temperature environment with the lock pin raised, gradually the pin may deform if a load is intermittently applied.

The spring section may become deformed and lose its springiness, which may cause poor locking, so care is required.

Precautions on Zipper Use

Tips when ironing or pressing

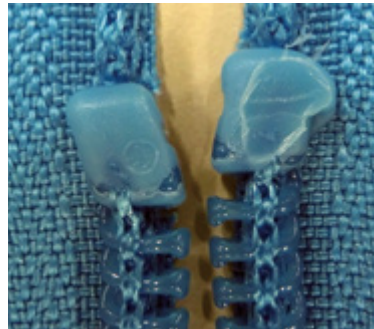

VISLON® / Coil Zipper

When exposed to a high temperature, the elements may deform or melt. Be sure to use a protective cloth when ironing garments with a zipper. Note that deformation may occur if the top / bottom stop or slider is made of plastic.

Examples of deformation and melting

Melted slider

Melted top stop

Maximum iron temperature

(Pressure 1.5 kg, 10 seconds still)

VISLON® Zipper	130°C
Coil zipper	160°C

Melted VISLON® elements

COSMOLON®

Be sure to iron materials from their back surface or use a protective cloth if you need to iron the front surface in order to prevent the iron coming into direct contact with the hooks or loops. Heat and pressure may stretch or crush parts which may lead to poor engagement (decrease in strength).

Cases of elongation and crushing

○ Hook in normal state

✗ Crushed hook

✗ Hook elongation

○ Loop in normal state

✗ Crushed loop

The countermeasures and cases introduced here refer to the major problems envisaged in normal usage/ sewing methods. It is not guaranteed that these measures can avoid all problems.

These cases may not apply to zippers used for special purposes or ones that sewn or attached in a special way. Be sure to consult with YKK representatives in advance and conduct full testing on your own in order to judge whether the product can be used or not.

Sliders to which an accessory pull-tab can be attached later

Sliders to which a pull-tab can be attached later include CA, CF, ZA, and ZF.

● CA / CF - types in which a pull-tab can be attached to the small snap hook attached to the slider

Choose a type of pull-tab with an attachment part designed specifically for CA / CF.

Attaching a non-standard pull-tab may damage the swivel hook.

CA [with automatic locking function]

CF [non-lock (free)]

● ZA / ZF - types in which a pull-tab can be attached directly to the slider body -

Choose a type of pull-tab that is compatible with ZA / ZF.

Attaching a non-standard pull-tab may damage the slider.

ZA [with automatic locking function]

ZF [non-lock (free)]

Pull-tab for CA/CF

Pull-tab for ZA

Pull-tab for ZF

※The items above are just examples.

Notes for using sliders to which a pull-tab can be attached later

In addition to the ones listed above, there are some types of sliders to which a pull-tab is attached using a tool such as DADC, DFDC, and DFNT2. Attaching a pull-tab may affect product functions or appearance depending on the pull-tab's dimensions and how it is attached.

Please thoroughly understand the following before use.

- When creating a pull-tab, please make an inquiry to YKK representatives about the shape of the attachment and other issues.
- Do not perform any rework such as removing a pull-tab that has been attached once.
- We do not recommend using coated products (such as some plated products) with a high possibility of peeling off during processing or use.

Please understand YKK takes absolutely no responsibility for the change in quality and performance of its products caused by parts manufactured by a third party other than YKK or processes carried out by a third party.

Remarks for Clear Coil Zippers

- Specify petroleum-type dry cleaning.
- The crosswise strength of the tape is slightly lower than that of standard tape.
- Wash with water temperature under 40°C to prevent the nylon transparent tape from shrinking.
- Cover with fabric when ironing, at a low temperature between 80°C and 120°C.

Remarks for VISLON® Transparent Type

- Specify petroleum dry cleaning only.
- Chain strength is a little weaker than that of the standard item, so it is not recommended for an application with heavy load.

Proper Use / Sewing of 3CF Open-End and Two-way Open Zippers

- 3CF open-end & two-way open zippers are designed for thin and light fabric. To ensure light weight, the open parts of this product are made of plastic, so their strength is relatively low (about half of 5CN, which is generally used in the front opening of general garments).
- As such, please avoid using this product in heavy knit garments, garment with thick fabric, or where heavy load may be applied during garment use. Strong pulling or twisting could result in the breakage of the parts.

Do Not twist the open parts.

Also please note the following precautions for proper handling in order to avoid unnecessary damage or breakage.

1 Zipper Operation

◆ When Closing

1. Make sure the slider is positioned next to the box.
2. Completely insert the pin into the box end.
3. Pull up the slider.

◆ When Opening

1. Pull the slider all the way to the open parts.
2. Draw the separable pin out.

2 Ironing

1. Completely close the zipper and cover with a piece of fabric.
2. Ironing temperature should be below 130°C.
3. Be careful not to accidentally iron the plastic parts.

3 Sewing

- Sew outside the yellow line. (- - - -)
Do Not sew on the plastic part.

Proper Sewing Procedure for Zippers

Space for Slider

The slider needs some room to move for the zipper to work.

If the stitch is made right by the edge of the elements, the slider will easily catch the adjacent fabric.

Please make sure to allow enough space for slider operation.

Lining fabric especially gets easily caught in the sliders, so sew on the part away from the elements and secure the edges with a sewing machine or prick stitch if a lining is used.

Allow enough space for slider operation.

Sewing Long Zipper

To confirm the compatibility between the fabric and the zipper, tack the zipper onto the fabric before actually sewing on the fabric to check their elongation and so on.

Knit fabric especially requires this preliminary check.

Sewing onto Shaggy Fabric (Fur, Shaggy, etc.)

When applying zipper onto shaggy fabric, place cover fabric such as leather at the edges in order to prevent the slider from catching the fabric.

Sewing Zipper on Pants Flies

Saddle stitch can reduce the load on the bottom stop.

Pants using a short zipper or tight-fitting pants especially place great load to the stop, so applying the saddle stitch is strongly recommended.

Sewing CONCEAL® (Closed-End) Zipper onto Fabric

Prepare a zipper approx. 30mm longer than the actual garment opening.

Movable Bottom Stop (only 2cc / 3cc)

The movable bottom stop is provided to prevent fraying of the fabric at the opening end. Fraying by the slider movement can be prevented by fixing the stop about 5mm above the opening end point with a special attaching tool.

Precaution for Zipper Sewing

Sewing CONCEAL® (Closed-End) Zipper onto Fabric

When the opening end is already sewn

- Place Body A and B together and sew to the opening end point.
2) Make sure to backstitch at the end point.
3) Mark the end point on the fabrics.
- Put together the body fabrics and the zipper, then mark the end point on the zipper.
- Pull down the slider to the bottom stop, then sew on both sides of the zipper, making sure both markings are met.
2) Use the YKK sewing machine foot, raising the element up and fitting it in the groove of the foot.
- Sew on the zipper to the opening end point.
2) Backstitch the beginning and the end of the stitch.
※Do not cross the zipper stitch lines with the body stitch line; leave room for the slider pull-tab to pass through.
- Bring the slider pull-tab out to the front side, then close the zipper.
- Position the movable bottom stop about 5mm above the opening end point, then secure it using the special attaching tool.
2) The stop prevents the fabric at the opening end from fraying.

Precaution for Zipper Sewing

When sewing the opening end after attaching the zipper to the bodies

Precautions on Sewing CONCEAL® (Closed-End) Zipper

When CONCEAL® zipper is used in a tight-fitting garment such as a dress. The elements inside the garment may scratch against the user's skin.

Proper Sewing

Please wrap the part below the movable bottom stop in a fabric backing or put a patch to prevent the elements from scratching against the user's skin.

Fabric Backing

A Patch

Sewing CONCEAL® (Open-End) Zippers

3CH

Sewing on the Retaining Box Side

- Start sewing from the top of the zipper using the YKK sewing machine foot, to about 30mm from the bottom stop.
- Pull up the slider and the retainer box at approx. 30mm from the bottom, and then continue sewing beside the element edge.

Sewing on the Insert Pin Side

- Start sewing from the top of the zipper using the YKK sewing machine foot.
- At least 15mm from the bottom stop, switch to a narrow foot and sew at least 2mm away from the elements to the bottom.

Attention

Preferred sewing conditions
 Sewing Pitch: 2.5mm
 Backstitch: 1 backstitch
 ※Sewing pitch that is too small and repeated backstitches will cause the tape to break.

Attention

Sewing on the very edge of the insert pin may make it difficult to insert the pin into the slider.

5CH

Sewing the Retaining Box Side / Insert Pin Side

- Using the YKK sewing machine foot, sew right beside the element edge until the point approx. 19~20mm from the bottom.

- Switch to a narrow foot and move slightly (over 3mm) away from the elements, then continue sewing to the bottom.

Attention

Sewing the very edge of the open parts may cause the open parts to break.

Precautions for sewing Coil Zippers

- During the spacing process of the coil zipper production, elements are cut and removed from the zipper tape. Occasionally, a half element (remaining after cutting) may be left behind next to the top stops of the zipper, and such cut element may be protruding if the top extension of the zipper tape is bent closely to the top stops during the garment sewing processes.
- The sharp cut end of the protruding element may scratch a user/consumer.

Solutions

- The top extension(s) of the zipper tape should be bent at least 5mm away from the first element (at the top stop position). This would prevent the elements from protruding.

- Selecting the P-TOP (plastic top stops) products can prevent the exposure of sharp cut element, and is highly recommended for infants' / kids' garments.

Warnings and Requests When Sewing the P-TOP

- When stitching the zipper, if the sewing machine attachment or feed dog comes in contact with the top stop and damages it, it could create a jagged edge which can lead to injury.
Example of such damages:

VISLON® (NEWKOB4) damage example

Coil zipper (P-TOP) damage example

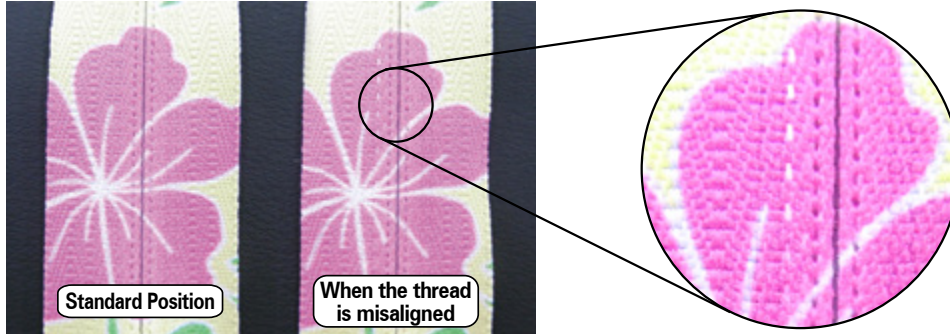

Solutions

- Please be mindful that the sewing machine attachments or feed dogs do not come in contact with the top stop when sewing near the top stop or the top extension.

Caution When Sewing PRIFA® Zippers

■ The threads in the printed section could protrude or shift when the rail edge of the slider interferes with the tape.

When sewing PRIFA® zipper, the tape thread may get misaligned if excessive force is applied on the print part by the bend created by the slider.

The cause of the tape thread's misalignment:

When sewing with the zipper opened, the sewer will need to move the slider as they sew. The slider will not move smoothly if the stitchings are too close to the elements, and the rail edge of the slider will interfere with the tape, leading to floating or misaligned thread on the print.

Solutions

- ① Please select an area for proper stitching that allows for smooth slider operation.
- ② When moving the slider, please raise the sewing machine foot.
 - In particular, the slider rail edge tends to interfere when closing the zipper.

Raise the sewing machine foot

Attention

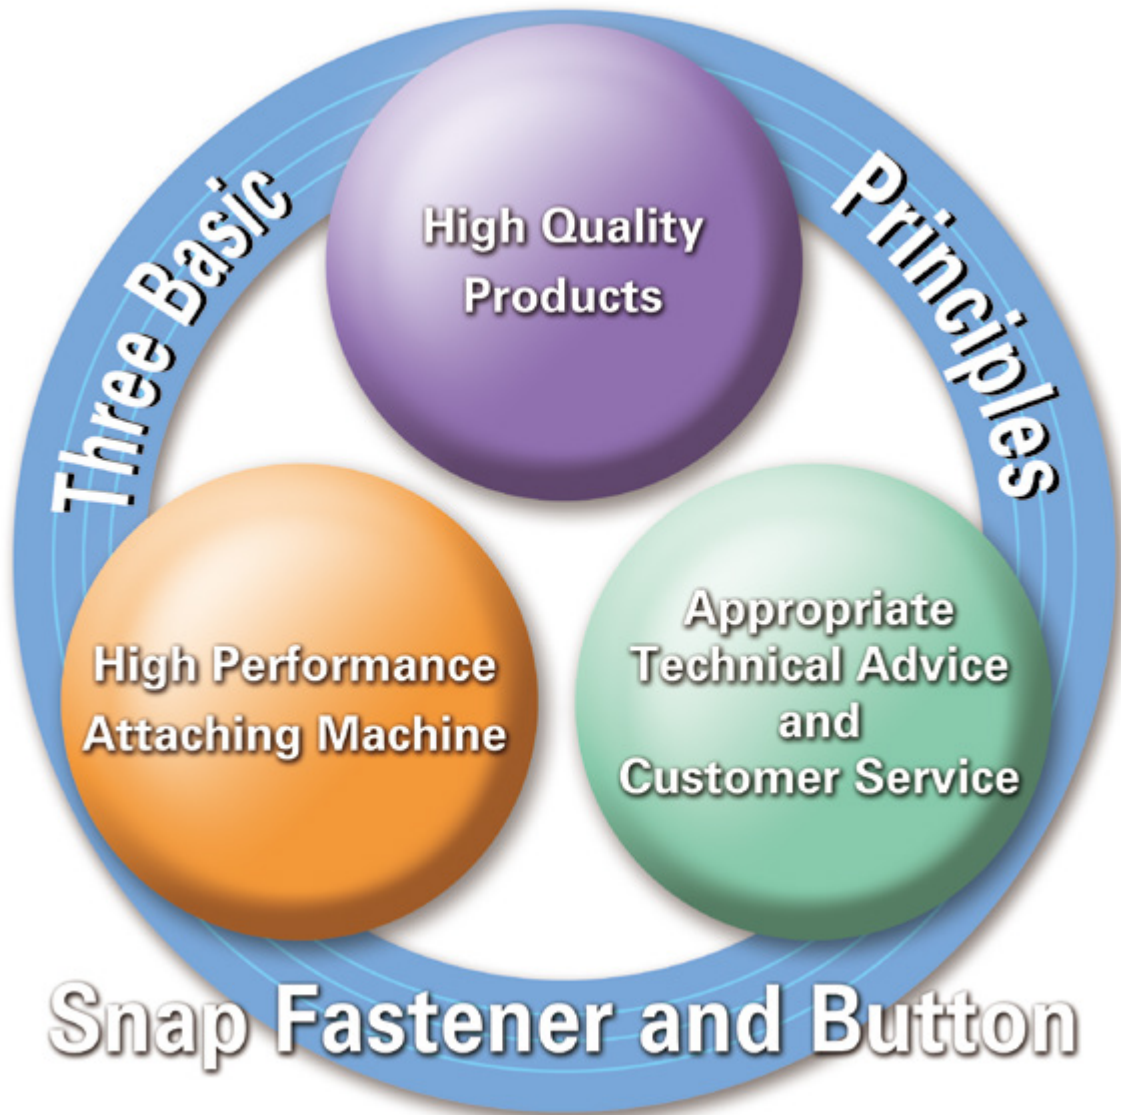

Please refrain from using fixtures such as perforators when moving the slider, as it may cause paint and chrome plating to peel off or create sharp edges.

Zipper Problems and Solutions Q & A

#	Q	A
1	I used the No. 3 zipper with a thick material, which caused punctures and breakage in the open parts.	<ul style="list-style-type: none"> ●When using thick materials, please use zippers above No. 4.
2	The zipper open parts broke.	<ul style="list-style-type: none"> ●For open-end zippers, confirm that the insert pin is firmly inserted when pulling up the slider.
3	Is there anything in particular to be cautious about with the open-end No.3 coil zipper (3CF)?	<ul style="list-style-type: none"> ●The 3CF has fine elements, so even if the insert pin is not inserted firmly into the box, it is possible to pull up the slider by force, in some cases damaging the open parts rib support. This is especially the case if the fabric around the insert pin is ribbed, making it difficult to operate, or the zipper is long, making it difficult to see the ends while operating it. ●When sewing, do not sew over the open parts rib support.
4	The front zipper of a garment comes down on its own.	<ul style="list-style-type: none"> ●Use an automatic slider (DA), which locks when not operated. ●Using a pull-tab that is too big or heavy could lead to the slider being unlocked or breaking while walking.
5	Post-processes such as washing or bio-stonewashing discolor or corrode the zipper, damage its slider or cause it to transmit its color.	<ul style="list-style-type: none"> ●We recommend YG type and GS type zippers, which have superior durability to post-processes. Among the element colors, be particularly cautious with GK, GKB, GTH and GDS. ●In order to avoid secondary damages from the residual chemicals used in post-processes, make sure to adequately neutralize, rinse, and dry quickly.
6	The zipper used on wool and feathered products changed color.	<ul style="list-style-type: none"> ●Wool and feathered products are susceptible to residual chemicals such as bleach, causing the metal part of the zipper to react and become discolored or corroded in storage. Neutralize adequately, and select items not easily susceptible to the influence of residual chemicals such as VISLON® zippers and coated sliders.
7	The metal part of the zipper was discolored.	<ul style="list-style-type: none"> ●Metal parts may corrode depending on the storage condition. There is a risk of the corroded parts staining the product, so products should be kept at low humidity, avoiding hermetically sealed storage in plastic bags or cardboard boxes and allowing some breathability in storage (please be aware of the influence of NOX as well). ●Do not use rubber bands to tie zippers together, since the sulfur in rubber bands can cause the elements to corrode or discolor, or cause the tape to turn yellow. (This problem occurs even when the rubber band is used over a plastic bag.) ●The use of cleaning products containing fluorine, or contact with fabric on which such cleaning products has been used causes metal parts to be discolored. Please be cautious of this. ●We recommend EVERBRIGHT®, which is comparatively resistant to discoloration.
8	The part of the garment that is in contact with a metal zipper became dirty.	<ul style="list-style-type: none"> ●The element surface of the metal zipper is coated with lubricant. The lubricant itself is colorless and transparent, but the metal powder (element shaving) created by opening and closing the zipper, as well as dust, etc. adhering to the lubricant, may contaminate the fabric if these are transmitted along with the lubricant upon contact with the fabric. Be cautious when using metal zippers with light-colored fabrics or absorbent fabrics. When ironing (with steam in particular), be aware that the same effect may occur. ●For storage, line the parts that contact the metal zipper with paper.
9	Skin contact with the zipper caused an allergic reaction.	<ul style="list-style-type: none"> ●Some elements and slider surface types contain nickel. Please select nickel-free products (special specification: N-ANTI).
10	While sewing, the sewing machine needle or attachment damaged the top stop and created a rough edge, causing injury.	<ul style="list-style-type: none"> ●The area around the top extension comes into contact with sewing machine needles and attachments from a variety of directions. In order to prevent damages, lower the starting position of the zipper by 5mm and compare the result. (See p64)
11	When opening and closing the zipper, it does not move smoothly or it catches the fabric.	<ul style="list-style-type: none"> ●When sewing, if the stitching is made too close to the elements, the slider will not have enough space to move, impeding its operation. Be careful to allow enough space (See p51). ●If the zipper catches because the fabric used is too thin or soft, you should put in a stitch or core to reinforce it.

#	Q	A
12	The zipper tape tore from the sewing position and broke.	<ul style="list-style-type: none"> ●The zipper tape is woven, so cutting the thread may cause fraying. Do not cut the zipper tape to reduce fabric pressure, to reduce interference from other parts, etc.
13	The elements warped or melted when I ironed it.	<ul style="list-style-type: none"> ●When applying an iron to the zipper, be sure to cover it with fabric. Be cautious of the zipper's heat tolerance (and the heat tolerance of the product itself). Zipper heat tolerance : CONCEAL® 160°C FLATKNIT® 150°C VISLON® 130°C Coil Zippers 160°C
14	A VISLON® element has broken or cracked.	<ul style="list-style-type: none"> ●If you try to open a slider with lock function by force without using the pull-tab, the elements may get torn off. When opening or closing the zipper, be sure to use the pull-tab. ●The material of the elements, polyacetal (POM), makes the elements susceptible to damage by strong acids. Do not clean the elements by soaking it in bleach, and if exposed to materials such as toilet cleaner or battery acid, be certain to wash it with water immediately.
15	The zipper was bent in dry cleaning.	<ul style="list-style-type: none"> ●Repeated dry cleaning or high-temperature drying without closing the zipper will cause it to bend. Be sure to close the zipper before washing, drying, or dry cleaning. (See p54)
16	The CONCEAL® no longer opens or closes.	<ul style="list-style-type: none"> ●If the slider is pulled up diagonally, the elements will warp and disrupt the interlocking mechanism, and it will break if it is forced up further, making it impossible to open or close. When closing the zipper, first fasten the button/hook, and pull up the slider along the elements so that it doesn't get pulled diagonally. ●Zippers are intrinsically hard to operate where fabric thickness changes, so do not use a CONCEAL® where fabric thickness changes.
17	The seam of a coil zipper for a bag broke.	<ul style="list-style-type: none"> ●There have been instances where seams break due to repeated contact with other parts of the bag, such as shoulder belts. Please be mindful when attaching other parts.
18	When using a pin lock (DP) slider in my pocket, the protruding part hurts.	<ul style="list-style-type: none"> ●Avoid the use of a pin lock slider, and use an automatic lock slider (DA) or non-lock slider (DF) instead.
19	We used an automatic lock slider (DA type) for a product that goes through a washing process, and the slider broke.	<ul style="list-style-type: none"> ●The pull-tab of the slider may break when it gets stuck within the tumbler, and chemical residue in the cover can corrode the slider. Please use the semi-automatic slider (GS), which is more durable and has a more suitable shape.
20	The paraffin melted from the heat from an iron press and blemished the clothing material.	<ul style="list-style-type: none"> ●The zipper elements are treated with paraffin in order to improve its sliding properties. When ironing areas directly touching the zipper, use a slip-sheet or fabric between a material and the iron.
21	Is there something I should be aware of when using a zipper for baby products?	<ul style="list-style-type: none"> ●We provide special products for babies, such as the plastic top stop. Please contact a sales representative.
22	The slider caught the material and tore a hole in it, or the zipper won't close because it caught the material.	<ul style="list-style-type: none"> ●Try to pull the slider the other way, as to loosen the caught material. ※This may cause the pull-tab to break, so do not try to force the slider to move. Instead, try moving it gently.
23	When I sent my clothes off for dry cleaning, the press broke the slider.	<ul style="list-style-type: none"> ●We have provided guidance to the cleaning industry to be careful with the sliders when pressing.
24	When I stored the zipper by tying them with a rubber band, the portion touching the rubber band changed colors.	<ul style="list-style-type: none"> ●The sulfur in rubber bands can cause the element to corrode, discolor, or cause the tape to turn yellow. Please refrain from using rubber bands, and use paper or cotton string instead. The same can occur for Cosmolon® as well.
25	The color of the zipper rubbed off onto my bag.	<ul style="list-style-type: none"> ●Contact with plasticizers, adhesives, and oils can cause the colors to rub off. Please be particularly aware of PVC, synthetic leathers, resin coated fabrics, etc. ●Please store with a slip-sheet.

Snap Fastener and Button Products Three Basic Principles

High Quality Products

YKK products are made of highly qualified selected materials under strict production testing.

High Performance Attaching Machine

YKK has a variety of high performance attaching machines, from manual to programmed types. They all possess a compensator device. Please refer to page 66.

Appropriate Technical Advice and Customer Service

With skilled Field Technical Support members, called FTS, appropriate technical advice and follow-up service are available.

Tack Button

Special designs, personalized logos, and variety of finishes are available.

Snap Fastener and Button Products

Snap

- Special designs, personalized logos, and variety of finishes are available.
- Combination of top and under parts can be chosen from our lineup.

S-Spring Snap (Item code: SW)

- Applicable for light-duty to standard garments.

Ring Spring Snap (Item code: SK)

- Applicable for standard to heavy-duty garments.

※Hidden use caps are also available for designs with concealed snaps.

Snap Fastener and Button Products

Ring Spring snap (Two-prong) (Item code: SX)

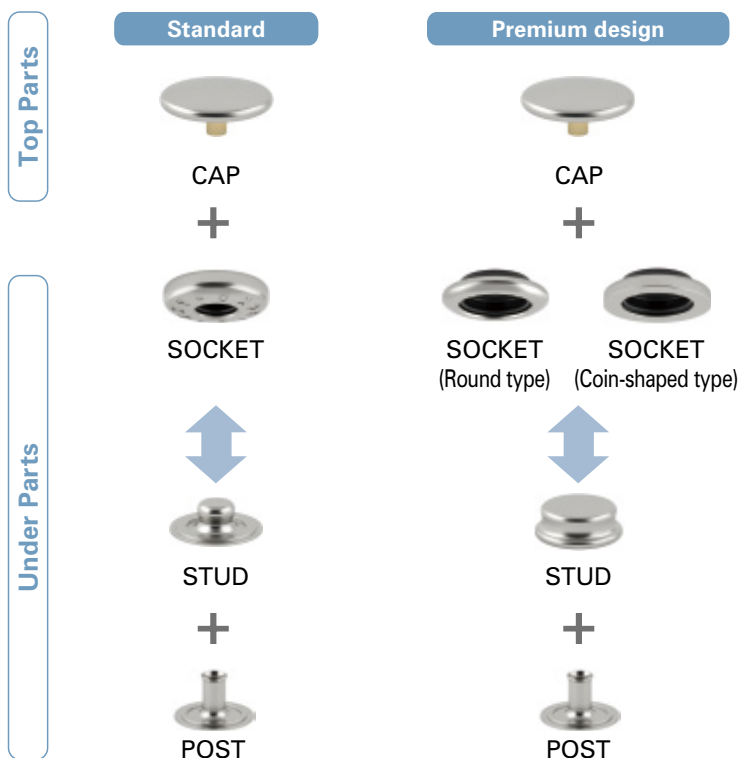

- The two-prong attaching system is one of the most historic methods around.
- With this feature, this snap system possess the means to minimize fabric damage and prevent rotation.

※Hidden use caps are also available for designs with concealed snaps.

Metal-Plastic Composite Snap

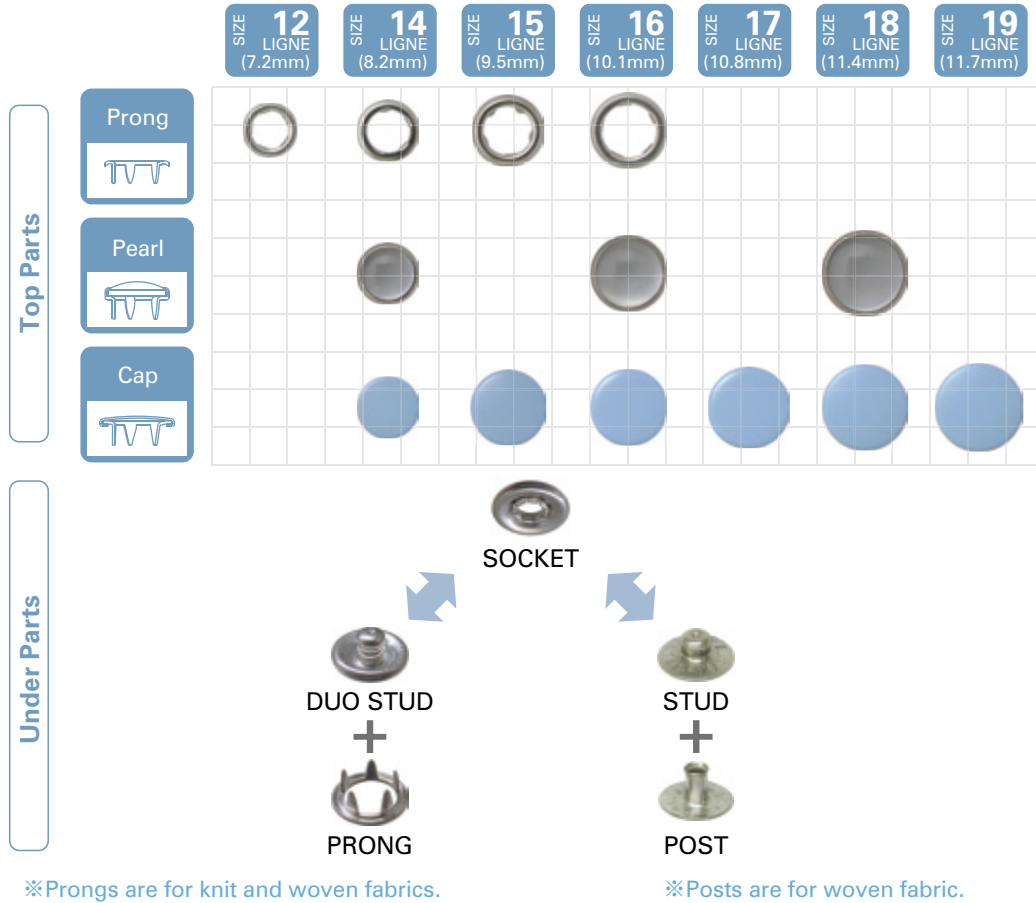

- A snap system that shows high performance and durability due to its plastic spring increasing its resistance to abrasion.

Snap Fastener and Button Products

SNAPET®

- Applicable for elastic / lighter fabric as the prong is less prone to getting caught in the fabric, limiting damage.
- Special designs, personalized logos, and variety of finishes are available.
- Dye-to-match to Prong and Cap are available.

Cap Variations

Plastic Snap

- Good for lightweight application. ■ Dry-Cleanable. ■ High Durability. ■ Self-Piercing.
- Metallic colors are available to match a METALUXE® zipper.

Tape Snap

- SOFIX® snap button is a tape snap which has plastic injected directly onto the tape.
- No need for attaching machines.
- Combination of Socket-Stud tape is available. (Usage example: for comforters, to fasten the ends of the comforter cover.)

Standard

Combination

Hook & Eye

■ Suitable for slacks, dress pants and skirts.

Waist Fastener

■ Suitable for children's pants.

Eyelet Washer

- Attachment to stretch fabrics is possible.
- Pre-piercing is not required.

Attaching Machine

MODEL 131

The Model 131 is a manual foot press type for low-volume production, and it can be used with most YKK® snap fastener items by changing the dies.

Specifications

Dimensions : 1,000mmH×460mmW×425mmD
Std. Equip. : Compensator

MODEL N-6

The N-6 is a semi-automatic attaching machine with powered foot treadle, and it can be used with most YKK® snap fastener items by changing the dies. Marking Light is equipped for easy positioning of attachment.

Specifications

Dimensions : 1,080mmH×340mmW×450mmD
Power : 200W Motor
Electric Source: 100V or 220V Single Phase
Weight : 68kg
Std. Equip. : Compensator / Safety Device
 Marking Light

MODEL N-7

This is an automatic model exclusively for Tack Button, Rivet Burr or Eyelet Washer. Register type is also available to fix logo direction.

Specifications

Dimensions : 1,340mmH×500mmW×560mmD
Power : 300W Motor
Electric Source: 100V or 220V Single Phase
Weight : 130kg
Std. Equip. : Compensator / Safety Device
 Marking Light /
 Automatic Feeder(Register Type)

MODEL N-8

This is an automatic model exclusively for SNAPET® snap buttons or Snap. It comes in a set of two units, one for attaching prong and socket and the other for stud and post (or stud and prong).

Specifications

Dimensions : 1,340mmH×500mmW×500mmD
Power : 200W Motor
Electric Source: 100V or 200V Single Phase
Weight : 110kg
Std. Equip. : Compensator / Safety Device
 Marking Light /
 Automatic Feeder / Gauge Plate

MODEL N-8-3H

This is an automatic model for SNAPET® snap buttons which allows you to choose the attachment order for 3 component SNAPET® snap buttons.

Specifications

Dimensions : 1,340mmH×500mmW×500mmD
Power : 200W Motor
Electric Source: 100V or 220V Single Phase
Weight : 120kg
Std. Equip. : Compensator / Safety Device
 Marking Light / Automatic Feeder
 Gauge Plate /
 Attachment Order Programming

MODEL N-8-4H

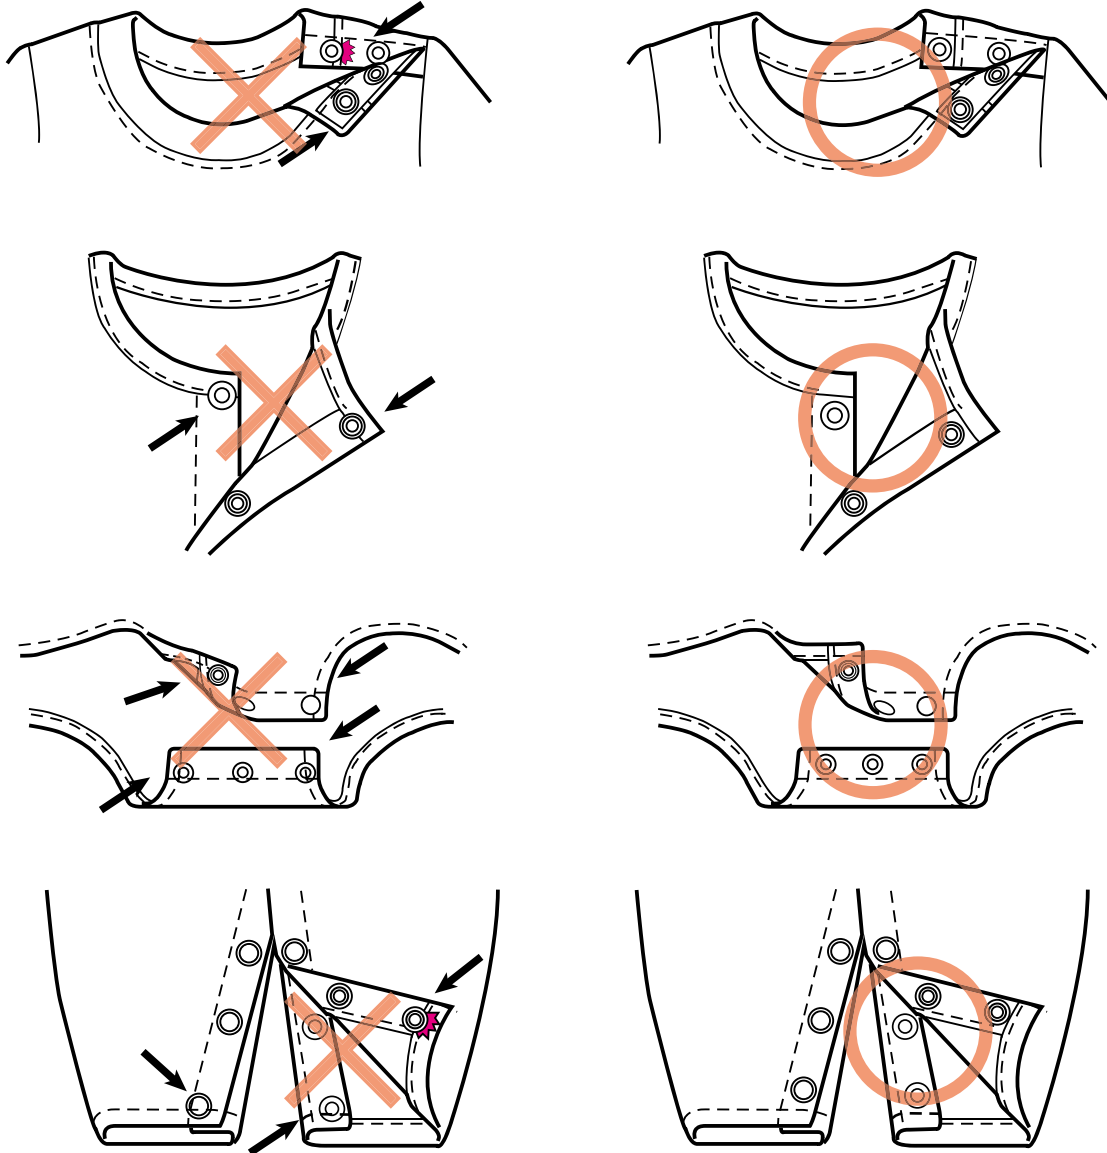

This automatic model allows you to program 4 components of SNAPET® snap buttons. Combination of different surface finish of Prong with Socket and Prong with Stud can be registered.

Specifications

Dimensions : 1,340mmH×500mmW×500mmD
Power : 200W Motor
Electric Source: 100V or 220V Single Phase
Weight : 130kg
Std. Equip. : Compensator / Safety Device
 Marking Light / Automatic Feeder
 Gauge Plate /
 Attachment Order Programming

Attachment Guide

Make sure to avoid attachment on uneven thickness, hem, and stitch. Attachment on uneven thickness may result in defective attachment, breakage of fabric, or weak snapping and unsnapping actions.

If a sewing pattern requires attachment on a particularly thick foundation, please contact your nearest YKK sales office.

Inspection Guide

At the beginning of the working day, be sure to check that there are none of the conditions marked with a X below. Snapping and unsnapping actions should not be too weak or too stiff.

Make sure the item is not turning and there is no damage or deformation.

The item may turn around if the fabric is too thin. Packing is required in this case.

Make sure the item does not come off easily. Try to pluck it off with your fingertip or nail. Make checking for this your routine at the beginning of the working day.

Make sure the fabric around the item is not torn. The item should not be attached on uneven thickness or over the stitching.

Attach inside the stitch line. Items over zipper tapes may cause fabric to tear.

Inspection Guide

During the attachment and inspection processes, be sure to check that there are none of the conditions marked with a X below, which may cause the fabric to tear or the items to come off.

Tack Button

Make sure there is no gap between the fabric and the Tack Button, and confirm they are firmly attached.

Rivet & Burr

Make sure there is no gap between the fabric and the Rivet & Burr, and confirm they are firmly attached.

Eyelet Washer

Make sure the tip of the Eyelet is properly curled, and confirm that the fabric does not slide off the attached Eyelet with a little pulling force.

Use some packing if the fabric is too thin.

Inspection Guide

Snap

Make sure the tip of the Cap is properly curled.

Make sure the Stud and Post are firmly attached.

SNAPET®

Make sure there is no gap between the fabric and SNAPET®, and confirm the SNAPET® is firmly attached.

Make sure the bottom of the SNAPET® Post is flat.

Inspection Guide

Before packing your garments, make sure to check that there are none of the conditions marked with a X below.

Tack Button

Make sure the fabric around the Tack and Button is not torn.

Snap

Make sure the fabric around the Stud and Post is not torn.

SNAPET®

Make sure the SNAPET® Prong is not protruding.

Check the back placket, and make sure that the Prong is not protruding there as well.

Eyelet Washer

Make sure that the attachment pressure is not too strong and the fabric is not torn.

Key Inspection Points

YKK Snap Fastener and Button items are made of various materials, and they may be vulnerable under certain conditions. See the following notes and prevent unnecessary problems.

Finishing

1. Ironing:

Do not iron directly on to the items. Direct ironing may cause scratches and deformation on metallic items and breakage or distortion on plastic items. If ironing is essential, place a fabric over the items and keep the appropriate temperature and avoid direct ironing.

2. High-Impact Press:

Problems such as deformation, breakage, stiff or weak snapping-unsnapping actions may occur, if the pressure is too strong.

3. High-Temperature Drying:

Plastic items, under high temperature, are less resistant to deformation, discoloration, and scratches.

Dyeing and Washing

■ Heavy chemicals used in the processing of fabrics or garments tend to affect metallic items, especially when they are not sufficiently rinsed and dried.

1. Sulfur Dyestuffs:

Sulfur dye process can result in corrosion on protective lacquer on all finishes, resulting in possible corrosion of the trim and/or staining on the garment fabric. As such, YKK recommends wash testing under bulk conditions before production.

2. Reactive Dyestuffs:

Reactive dye process can result in corrosion on all metal trims, especially under extreme or prolonged humid conditions. Resulting in possible corrosion of the trim and/or staining on the garment fabric. As such, YKK recommends wash testing under bulk conditions before production.

3. Dyeing On Garment:

YKK recommends all metal trims to be attached after the fabric dyeing process. This is to avoid any possible chemical reactions that can result in corrosion of the metal trim and/or staining on the garment fabric. If required to be attached before the dyeing process, please test under bulk conditions before production for variation approval.

4. Bleaching:

YKK recommends all metal trims to be attached after the bleach wash process as it can cause chemical reactions resulting in fabric failure, corrosion, and/or discolorations. If required to be attached before the bleach wash process, please test under bulk conditions before production for variation approval.

5. Stone Wash:

YKK recommends all metal trims to be attached after the stone wash process as it can cause abrasion and corrosion on metal trims. If required to be attached before the stone wash process, please test under bulk conditions before production for variation approval.

※Prior dyeing and washing tests are necessary to avoid any problems.

※Apply regular checks during bulk production.

Attachment on Leather Products

■ Leather goes through strong chemical treatments in its tanning process, and residues of such chemicals tend to discolor metallic items. Please consult your nearest YKK sales office for leather application.

Metal Ball Chain

YKK's ball chains are made of stainless steel material.

Because of their functional and fashionable characteristics, ball chains are used in a variety of fields.

Stainless (St.) BALL CHAIN					
Ball Size	Material		Ball Size	Material	
2.3	St.		4.0	St.	
3.2	St.		4.5	St.	

Attachment

Connector (CNA)

Coupling B (CPB)

Coupling C (CPC)

※Depending on the size, the attachments can be shared.

※Please use items that have appropriate properties for your desired uses.

Plastic Ball Chain

Plastic balls are attached to a nylon or polyester string, which is flexible, bends freely, and soft to the touch. Available colors are standard and bright fluorescent. A two-tone color ball is also available with string and balls of different colors.

Care Instructions

Care Instructions for JOYLON® Applications

- Avoid use on garments. JOYLON® is easily affected by twisting and folding which occur during washing and dry cleaning processes. It also has a weak tolerance toward chemicals.
- Avoid use for water-proof purposes. JOYLON® does not have water repellent functions.
- We do not guarantee the compatibility of JOYLON® with final products. Be sure to select the product compatible with your purpose of use and conduct tests for required quality. If you have any inquiries, please do not hesitate to contact us.

Care Instructions for JOYLON® Attachment

- Avoid use on curved application.
- Avoid use on excessively long part or where certain strength is required. It may interfere with closing of the seal.
- Conduct the adhesion test of the film in advance.

Care Instructions for JOYLON® Usage

- Avoid use in extremely cold (especially those made of PVC) and hot conditions.
- Keep closed after attaching. If kept open, the rail part may turn wavy.
- Avoid storing under direct sunlight for a long period of time to avoid the change of colors.
- Regardless of the production stage (i.e. chain roll, after processing), the product may get affected by factors such as temperature, humidity, and sunlight as shown

below:

PVC products: bleeding of plasticizer

Olefin products: Occurrence of lubricant powder

- There is a possibility of slight expansion and contraction by the change of temperature.

Care Instructions for PVC (vinyl chloride) Usage

- If stored in a cold condition, keep it at normal temperatures before use. If the product is used soon after, it may result in damage.
- There is a possibility that the temperature inside the product is still cold even after keeping it at normal temperatures. Make sure to let it stay for enough time.
- PVC products have a tendency of stiffening under cold temperatures. Even a light impact may cause them to break.
- Phthalate ester in PVC conforms to the standards of Oeko-tex® Class I and CPSIA.

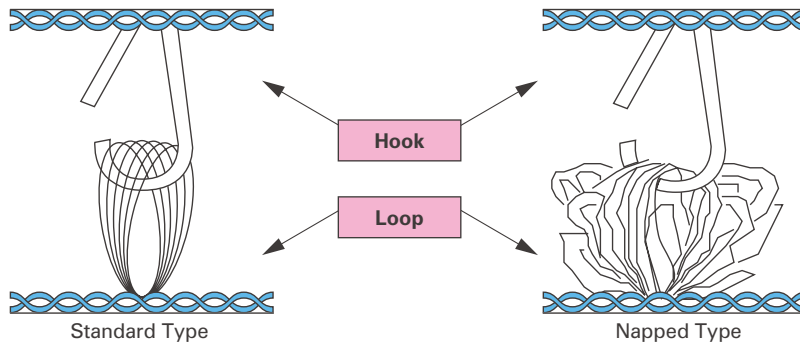

Care Instructions for 2EVVN/2EVTN/2PVVN Usage

- 2EVVN, 2EVTN, and 2PVVN are easy to open from the outer side but hard to open from the inner side.
- The "Round edge" is to help you check the correct direction of the chain. When attaching to the bag, make sure the "Round edge" is pointed to the outer side of the bag.

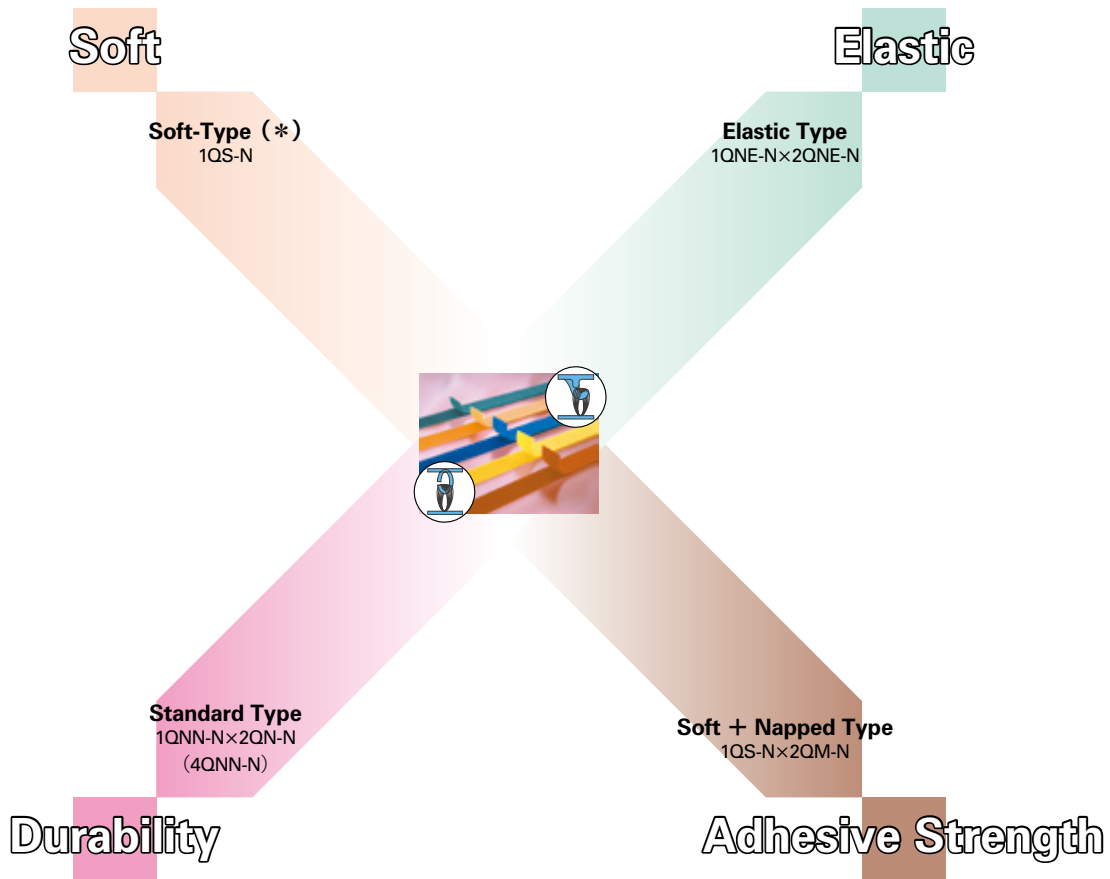

Principle of Cosmolon®

Engagement of Hook and Loop

Cosmolon® (Hook and Loop Fastener)

※Please consult with YKK sales representatives about the loop used with 1QS-N.

Hook

●Standard Hooked Type

Excellent in durability

●Injection or Extruded Type

Injection molded in various shapes to suite use

Loop

●Standard Type

Excellent in durability

●Napped Type

Excellent in engaging strength

Cosmolon®

Cosmolon® Types and Uses

		Kind	Material	Features	Main Uses		
Cosmolon® (Hook and Loop Fastener)	Hook Tape (A)	Woven	STANDARD type 1QNN-N	<ul style="list-style-type: none"> ■ Fish hook-shaped pile for reliable engagement. ■ Uses a thick monofilament hook. ■ Normal type 	<ul style="list-style-type: none"> ● Apparel ● Bags, pouches, shoes, gloves, belts, tool cases, and sporting, leisure and amusement goods. 		
			SOFT type 1QS-N	Nylon	<ul style="list-style-type: none"> ■ Fish hook-shaped pile for reliable engagement. ■ High-density pile with thin monofilament hook, softer to the touch, yet strong. 	<ul style="list-style-type: none"> ● Handicrafts, interior decoration items ● Trims and seats of automobiles, trains, and airplanes (fire-resistant type) ● Medical appliances such as corsets and tonometers 	
		Polyester		<ul style="list-style-type: none"> ■ Compared to nylon tapes, superior both in water resistance and UV-resistance. 	<ul style="list-style-type: none"> ● Medical appliances such as corsets and tonometers 		
		Injection	POWERHOOK® Button 1QJ * *.*	Nylon Polyester	<ul style="list-style-type: none"> ■ Injection molded type hook in various shapes. ■ The injection molded hook provides stronger shear and peel strength than woven hooks. 	<ul style="list-style-type: none"> ● Interior decoration items such as curtains ● Automobile-related items

Special Varieties of Cosmolon®

WE Type	Cosmolon® fasteners used in high-frequency welding onto soft PVC sheet.
WE-T Type	Cosmolon® fasteners used in high-frequency welding onto fabrics, textiles, etc. for a temporary bond..
AD Type	Cosmolon® fasteners with a double-sided adhesive tape on its reverse side for a temporary bond.
ADN Type	Cosmolon® fasteners with an acrylic-based adhesive on its reverse side for a temporary bond. ※1
ADS Type	Cosmolon® fasteners with a rubber-based adhesive optimized for low energy surface. General purpose. ※2
HMPP Type	Cosmolon® fasteners with a stronger rubber-based adhesive optimized for low energy surface, such as PP and PE.

※1. ADN type is applicable to soft PVC, however the ADN can react with plasticizers, affecting bond strength.

※2. ADS type and HMPP is easily affected by plasticizers within soft PVC. Please refrain from using ADS type and HMPP on soft PVC substrates.

FP type	Fire retardant hook & loop fastener which satisfies the U.S. Federal Automobile Safety Standards FMVSS-302.
FA type	Fire retardant hook & loop fastener which satisfies the U.S. Federal Aviation Specifications, FAA-23-853 (b)

■ Cosmolon® Sizes and Shapes

Widths : 16, 20, 25, 50 and 100mm

Put-up : 25m and 50m on spool

Cosmolon® Strength Test

● Shear Strength Test

● Peel Strength Test

(Under conditions of 20°C×65%RH)
fastened length of 50mm

※Tests based on JIS-L-3416-2000

Information concerning safe operation

Carefully read the following information so you can make the best and safest use of our fastening products.

YKK goes to great lengths to maintain the quality and safety of our products while making sure they are comfortable for our customers to use.

Our sales staff is prepared to assist you in all stages of your product development projects, from planning to setting up specifications. Feel free to consult with them at any time.

Caution

- Our plastic hardware is developed for luggage, bags, and apparel. If you use our product for any specialized use, and especially for one of the applications listed below, please contact your YKK sales representative.
 - Personal flotation devices (PFD), baby carriers (baby sling), or any other applications which are subject to particular standards;
 - stretchers, safety belts, or any applications which are for weight-bearing;
 - child seats, wheelchairs, or any applications for use to reduce movement;
 - hard hats or any applications which provide safety features.

The above list is provided by way of example and is not intended to be exhaustive. We cannot guarantee that a product is suitable for a particular application, and as such, you should always conduct your own tests.

- Once our products are attached to other items, there may be approved ways to pack, store, or ship them in order to ensure their continued high quality. For example, buckles should be correctly fastened in order to avoid deformation, breakage or detachment.
- Please contact your sales representative about the certification of Oeko-Tex standard 100 or others.

When using our products, you should

- Choose the right fastener for your application from our product line. Your YKK sales representative can help you understand the variety of our products, their sizes, strengths, and specifications.
- Select plastic hardware that is the appropriate size for the tape in your application.
- Refrain from using plastic hardware that has been exposed to or is covered in dirt of any sort. Product damage or malfunction may arise if the plastic hardware is not clean.
- Refrain from using plastic and metal parts in one unit because of the potential for product abrasion.
- Refrain from using goods left outdoors for a long time. Exposure to the sun and other elements may cause product discoloration and/or quality deterioration.
- Avoid using items that have been in contact with or near a heat source. Heat may cause product deformation and/or quality deterioration.
- Refrain from using goods that have been in direct or indirect contact with chemicals. Check for residual chemicals on all parts of plastic hardware whether applied by YKK or coming from another source.
- Refrain from using a product in a position that is subject to pressure, impact, or abrasion, or other condition where product deformation and/or damage may result.
- Only make your choice of YKK product after adequate checks have been made. The strength of YKK products depend on the materials used, its texture, the thickness of its webbing, the position of its weld line, and other factors which you will need to take into account. For further information, please contact your YKK sales representative.
- Due to certain material combination, noise from friction may be possible. If silent operation is necessary, please contact your YKK sales representative for detail.

Recommendations for using YKK Buckles

- When fastening a buckle, insert the plug straight into the intended socket until you hear a clicking sound indicating the two parts are interlocking. Next, lightly pull on both parts to confirm that they have been completely fastened.

Incomplete fastening may result in product deformation and damage to any article attached to the buckle, especially if the plug comes loose from the socket. If the two parts cannot be fastened together, check again for any foreign material. Do not try to force the plug into the socket.

- Buckles should not be used in positions where they will be put under external pressure.
- All plastic materials deteriorates over time. Buckles that have been used for a long time should be checked for damages, cracks, deformations, and abrasions before each use. If any abnormalities are found, stop using them immediately. Use in such circumstances may cause further product damage and/or malfunctions.
- Completely remove any foreign materials including dust, sand, or mud from buckles before use.
- Situations which involve the application of excessive pressure or impact to a plastic fastener, such as being stepped on, struck, or thrown, will result in lower performance.
- We will not be held responsible for damage to the buckles or unauthorized modification of buckles.

Material Properties

- All of our products are limited by the properties and qualities of the materials used.
- Some products have a weld mark (the line that forms when materials bond within its mold during production). The mark is not a defect, damage or crack. Please check the product carefully before using.
